RESPONSIVE ARCTIC AIR POWER

AIM

1. The aim of this paper is to provide an overview of three potential options to improve the efficacy of Royal Canadian Air Force (RCAF) Arctic air power. Future areas of study should include a comprehensive study of the optimal balance of payload, speed, austere airstrip and surveillance capability; and engaging industry about fleet provision and sensor opportunities.

INTRODUCTION

2. Arctic¹ sovereignty is a critical national security imperative. The future operating environment will see a greater emphasis on the Arctic. Shipping, tourism, and energy exploitation all pose unique security threats.² Yet, the RCAF is ill prepared to meet these challenges with the equipment that they have today or will have tomorrow.

3. This paper argues that air power is a critical enabler in the Arctic environment. Yet, the bulk of the air power the RCAF uses comes from the South. This imposes both an opportunity cost on the Government of Canada and limits the presence of the Canadian Armed Forces (CAF) in the North. This paper demonstrates the existing gaps faced by the RCAF using a spreadsheet model.³ Using the findings of this model, a small set of high-level mandatory requirements is developed and three options for partially closing or completely closing the air capability gap are proposed. Finally, this paper calls for further modelling and the examination of this problem by

¹ Defined in this paper as the area of Yukon, Northwest and Nunavut territories.

² Canada., *Canada's Northern Strategy : Our North, Our Heritage, Our Future = Stratégie Pour Le Nord Du Canada : Notre Nord, Notre Patrimoine, Notre Avenir = Kanataup Ukiuqtaqtumiunginnut Upalungajautingat : Ukiuqtaqtuvut, Iliqkusivut, Sivuniksavullu.*, 4 - 8.

³ See Annex A

industry. By comprehensively addressing the problem of Arctic airlift and surveillance now, it will ensure that Canada has the right solution for an affordable price for years to come.

DISCUSSION

4. To meet strategic imperatives, the Canadian Armed Forces (CAF) has several tasks in the *Canada First Defence Strategy* (CFDS). These tasks include controlling and demonstrating presence and sovereignty, and responding to threats on an as needed basis.⁴ These requirements translate to air tasks of movement, personnel recovery, sense and air defence.⁵ Importantly, Canada must keep RCAF assets in the north to have the credible presence demanded by the CFDS.

5. The Arctic is an excellent, yet challenging, environment for air operations. Environmental, tasking, and integral factors impact air power's use in the Arctic.⁶ Aircraft face no armed opposition, but must deal with environmental threats. These threats include severe weather, trackless geography, and long distances through the area of operations (AOR). Cargo operations supporting the North Warning System (NWS), and Alert during "Box Top" missions, account for the bulk of the cargo flown.⁷ Finally, transport assets need to be integral within the

4 CFDS, 8; Statement on Canada's Arctic Policy, 6; Lajeunesse, *The Canadian Armed Forces in the Arctic : Purpose, Capabilities, and Requirements.*, 2.

5 The NORAD mission will not be discussed further in this paper except in terms of support to the North Warning System. Although the CAF's defence posture is under review, there is little sign that there will be major departures from existing policy. Liberal Party of Canada, *A New Plan to Strengthen the Economy and Create Jobs with Navy Investment.*, 2

7 "Archived - Resupply Mission to the Arctic a Success - Canada News Centre."

RCAF. Both cost and responsiveness,⁸ particularly if there is failure in, or threat to, the NWS demand military airlift.

6. Sense in the Arctic context means building situational awareness. Situational awareness is not only for the RCAF, but also for other governmental departments and the political leaders.⁹ Remote sensors, such as RADARSAT provide strategic sensing. Manned surveillance flights from CP-140 support the Arctic sense function as required.¹⁰

7. The Arctic is fully, but inefficiently, serviced by existing domestic air power. Integral CC-138 Twin Otter aircraft based in Yellowknife provide tactical lift throughout the AOR. Although it's a slow aircraft with limited payload, they are able to move limited numbers of troops and supplies to wherever needed. Tactical and strategic airlift in Trenton have the capacity and speed to service most locations in the AOR on an as needed basis. Finally, CP-140s are capable of providing high-end Intelligence, Surveillance, Targeting and Reconnaissance (ISTAR) coverage.¹¹

8. Yet gaps remain. Southern-based assets are high-demand and may be tasked to higher priority.¹² Further, the capability of the southern-based assets often exceeds the level required

⁸ Defined in the paper as being able to reach any point in the AOR within one day.

⁹ Building a common operating picture for self and others. Canadian Forces Aerospace Warfare Centre, *B-GA-402-000/FP-001 Canadian Forces Aerospace Sense Doctrine.*, 8 & 9.

for the Arctic.¹³ Finally, although the speed and reach of the Southern assets enable Northern access, their existing basing is not a permanent presence in the Arctic.

9. Besides the RCAF, commercial lift is accessible in the Arctic. Several companies offer scheduled and charter service throughout the Arctic. Yet, the cost of contracted lift is high, with cargo transportation costs often exceeding \$11 per kilogram.¹⁴ Airfreight is cost effective only when moving the high value cargoes. Finally, the commercial carriers do not have the unlimited liability or the flexibility of military air power. If a threat to life exists or timelines are short, commercial air support may not be viable.

10. With this in mind, gaps exist within the current employment of air power in the Arctic. Although with enough effort every community and military site is accessible by air, the tyranny of time and distance impede the efficient use of air assets.

11. A high-low mix best characterizes the existing air fleet. The high-end platforms in the south have the capability to support the Arctic when they are available or retested. The low-end northern assets have the responsiveness but lack the range, payload and speed to provide sustained or rapid response within the theatre. Table 1 below shows the properties of the RCAF transport and ISTAR fleets.

¹³ For example, the ASW kit on the CP-140 is of limited utility over land or ice.

¹⁴ First Air, *Domestic Cargo Rates FOB Yellowknife*.

Aircraft	Location	Range (KM)	Speed (KPH)	Range (NM)	Speed (KTS)	Payload (KG)
CC-138	Yellowknife	1427	337	771	182	1375
CC-130H	Trenton	7222	556	3900	300	19090
CC-130J	Trenton	6852	660	3700	356	19090

CP-140	Comox	7400	750	3996	405	0

Table 1: Airframe Capabilities

12. Time is an important consideration when planning air operations. Transport Canada regulations places a fourteen-hour limit on crew operation in a day.¹⁵ Missions that exceed seven hours in length require another crew to fly once the first crew hits their time-limit or the aircraft needs to stop for forced crew rest. Distance is the next factor. Once the aircraft has exceeded 50% of its range,¹⁶ it will need to refuel to get home unless the aircraft is going on a longer mission with a refuelling stop. In either case, refuelling eats into crew time, bringing them closer to the fourteen-hour limit.

13. Missions now fall into three categories. The first category of missions is between one and seven hours away from the base. These are simple operations for one crew. The second category is the seven to fourteen hour operations. These require multiple crews or several days to complete the mission. Finally, there are the missions that take over fourteen hours; they are highly complex missions that likely require significant preplanning to execute. Table 2 below shows the existing capability of military aircraft to reach each location within the Arctic, and how long it takes to get there.¹⁷

¹⁵ Note that crew days may be extended by the commander by 20 hours if need be. This paper assumes that this is only done *in extremis* due to potential risks of a fatigued crew. "Canadian Aviation Regulations.", 720.16(5).

¹⁶ Technically the fuel, but for ease of discussion the max range is used. Max range in this paper is the the range the aircraft can fly with maximum payload (i.e. minimum fuel) with a 10% reserve and with out air-to-air refuelling.

¹⁷ There are 137 communities, mines and defence installations with air strips within the Arctic area. See Annex A, Appendix One.

Airframe	One-Way Mission Length (Hours)	Number of Sites Accessable per Basing Location					Percentage of Total Sites Accessable at Each Basing Location

Table 2: Accessibility

14. From this table we see that the CAF has the capability to responsively provide air power in the Arctic if out of theatre assets are used. The northern based CC-138 can reach 80% of the Arctic communities within seven hours, and the strategic CC-177 and CP-140 can reach effectively all of the communities from their locations. The CC-130H & CC-130J can reach 61% and 74% of the Arctic locations from Trenton, and 100% of they are based out of Yellowknife. Finally, if the CC-138's are moved to Inuvik or Iqaluit, the number of communities that can be reached within seven hours falls to 68% and 37% respectively.

15. Responsive air power plays an important role. It underlies the rapid ability to transport cargo, support North American Aerospace Defence Command (NORAD) operations, and other critical Government of Canada priorities in the Arctic. Further, it will enhance northern situational awareness by allowing aerial confirmation of sovereignty violations or pollution before the offender has time to leave. As well, responsive air power can be used to support vital Search and Rescue (SAR) operations that save lives within the Arctic area. By providing aerial

surveillance, communications relay, and potential aeromedical evacuation once the endangered person is located, lives will be saved.

16. Two gaps are evident. The main gap is the responsiveness of existing Arctic air power. The distances involved combined with the physical characteristics of the airframes prevent the CC-138 from reaching any point in the Arctic within seven hours. Secondly, ISTAR is constrained. Without an organic tactical ISTAR capability in the north, support to SAR is low, and the ability to confirm target cues from RADARSAT or other sources is limited.

17. Together, a small set of high-level mandatory requirements emerges. To fill the gap candidate aircraft must have an unrefuelled range of at least 1421nm,¹⁸ a speed not less than 200 kts, be able to land on an austere airstrip and possess a light ISTAR capability. Austere air field capability is critical. Without an ability to deal with loose surfaces, most northern air field are out of bounds. So long as the aircraft can operate off these strips without needing extensive inspections, then the aircraft meets this requirement. This provides responsive air power from Yellowknife that can reach any point unto, and including, Alert within seven hours.

18. There are several options that meet some or all of these requirements. The three presented are “status quo plus,” “forward tactical air power,” and “Advanced Multi-Role Light Aircraft.” These options have a few common assumptions. Firstly, the aircraft will be based in Yellowknife. Second, any landings in areas off airstrips can be provided as needed by helicopters of the option does not retain the CC-138.¹⁹

¹⁸ Including a 10% fuel reserve.

19. Option 1: Status Quo Plus. The RCAF plans on life-extending the CC-138 platform. By replacing key airframe parts and avionics the existing capability may be retained out to 2025²⁰ for a cost not to exceed forty million dollars. By adding targeted upgrades, the CC-138 fleet may provide an ISTAR capability along with the same level of tactical mobility.

20. Advances in electro-optics have reduced the size and power draw of sensors. Overland ISR, particularly support to SAR or sovereignty patrols, may be enabled by commercial-off-the-shelf electro-optical turrets and synthetic aperture systems.²¹ By combining the two systems, large areas of land may be automatically scanned and targets of interest identified. Several existing systems have a small foot print when installed on a CC-138 and do not hurt aircraft performance. Indicative solutions include the L3 Wescam and Flir systems series of turrets and Thales's radar pod.²²

21. Advantages of this course of action are abundant. There is no retraining need for the CC-138 crew or technicians. The RCAF builds on the decades of accumulated experience with this airframe. Lastly, costs are lower fixed at the forty million plus the cost of the ISR equipment. Disadvantages include retaining a platform that fails two of three requirements along with

¹⁹ The Yellowknife basing assumption levered the existing air support available at Yellowknife airport and the fact it is collated with the headquarters. Southern basing is excluded as it would remove a "presence" from the north. The CC-138 can land almost anywhere when it has tundra tires. This paper assumes that this capability is replicated when operationally needed by helicopters, either military or commercial.

²⁰ "CC-138 Twin Otter Life Extension Project."

²¹ Synthetic aperture radar is a type of signal processing. It combines several hundred radar returns from different angles of the same target to build an artificial picture of the radar target. The effect is to enhance radar resolution as if the size of the radar antenna is much larger. When applied to ground mapping, the final resolution is only limited by the wavelength of the radar beam. Centimetric or millimetres radar would give sufficient resolution to cue man-sized objects.

²² The MX-15 is in Canadian service. All turrets are available with a 15" base and may use common wiring and interfaces. This allows for a comparatively simple systems integration effort. "WESCAM's MX-15: EO IR ISR Systems."; "FLIR Airborne Systems."; Thales, *I-Master GMTI/SAR Radar*.; Ibid.

potential loss of capacity due to the ISR system. Finally, a small fleet of unique aircraft will still need to be supported.

22. Option Two: Forward Tactical Air Power. As we have seen in Table 1, the CC-130H/J can reach all locations within the Arctic AOR from Yellowknife. This option sees the CC-138 be divested, and replaced by three CC-130H/J aircraft²³ that are currently based in Trenton.

23. The northern deployment of CC-130H/J yields a dramatic improvement in responsiveness and lift capacity.²⁴ Further, fitting a small ISR package like the one described above provides the required ISTAR capability. Table 2 above shows the improvement in service provision compared with the CC-138.

24. Advantages of this approach include fleet harmonization through the elimination of the CC-138. Responsiveness and lift capacity is improved along with reduced reliance on contracted air. Disadvantages include having to retrain aircrew and technicians and establishing a CC-130H/J support capacity in Yellowknife. As well, there is an opportunity cost of having dedicated CC-130H/J airlift in the North. Finally, fuel costs will increase due to the CC-130 having four thirsty T-56 turboprops versus the thrifty PT6-A on the CC-138.

²³ Based on worst case 80% availability, three airframes will yield a total availability of 99.2%. This exceeds the combined basing effectiveness of the current system as noted in the 2013 SAR Posture Review. "Search and Rescue Posture Review 2013."

²⁴ Combined CC-138 lift capacity of 5500kg vs 5720kg for the three CC-130H/J.

25. Option Three: Advanced Multi-Role Light Aircraft. The final option presented envisions replacing the CC-138 with four new light aircraft. By following a “dry-lease” system,²⁵ aircraft maintenance is assumed by contractors and minimum availability can be contractually established.

26. Several light and ruggedized aircraft exist that meet these minimal requirements. Indicative solutions include the King Air 350ER,²⁶ the P180 Avanti,²⁷ and the PC-12.²⁸ The King Air is in service as a multi-engine basic training in the RCAF and the PC-12 is in service with the Royal Canadian Mounted Police. The P180 is the fastest turboprop aircraft in service and it, like the King Air 350ER; have multi-purpose ISR/transport designs serving military customers. The PC-12 has am ISR configuration designed but not in service. Table 3 summarises capabilities.

Aircraft	Range (KM)	Speed (KPH)	Range (NM)	Speed (KTS)	Payload (KG)
King Air 350ER	4741	561	2560	303	947
P180 Avanti	3185	745	1720	402	771
PC-12	3417	528	1845	285	485

Table 3: Light Aviation Capabilities

27. Table 4 shows the advantages of using modern light aircraft in this role. Using any of the three indicative options, the RCAF improves seven-hour responsiveness 20% over the CC-138. Over the CC-130H/J based in Trenton, responsiveness is improved 50% and 33% respectively.

²⁵ A dry-lease is where the aircraft is fully taken care of by the lessor except for fuel and air crew.

²⁶ "King Air 350ER."

²⁸ "Pilatus PC-12."

Airframe	One-Way Mission Length (Hours)	Number of Sites Accessable per Basing Location		
		Yellowknife	Inuvik	Iqaluit
King Air 350ER	0 - 7	137	136	133
	7.1 - 14	0	1	4
	14.1 +	0	0	0
P180	0 - 7	137	136	137
	7.1 - 14	0	1	0
	14.1 +	0	0	0
PC-12	0 - 7	137	136	122
	7.1 - 14	0	1	15
	14.1 +	0	0	0

Table 4: Improved Accessibility

28. Advantages of this option include minimal RCAF support as the bulk of the maintenance is with the contractor and the CC-138 is divested. The RCAF enjoys lower operational costs compared to the CC-138 or CC-130H/J. Finally, availability rates are guaranteed. Disadvantages include potentially needing to requalify CC-138 aircrews. Further, aircraft service away from Yellowknife needs to be examined.

29. All three options improve strategic outcomes in the north. The first option enables the CC-138 to perform ISTAR tasks, freeing CP-140 from these tasks. This markedly improves northern situational awareness and safety of life in SAR situations. Option two improves the ISTAR situation and massively increases transport capacity and speed. Contracted air costs would fall, but supporting the CC-130H/J in Yellowknife could be problematic. The third option provides the ISTAR and responsiveness of the second option at lower cost and reduced lift capacity.

30. As in all things, there are trade-offs. The proper balance between speed, capacity, and ISTAR performance needs to be determined early. It is impossible to say for certainty within the scope of this paper what this balance is. It is imperative to engage Defence Research and Development Canada (DRDC) to do a comprehensive modelling of Arctic air mobility/ISTAR requirements.

CONCLUSION

31. This paper argues that the current RCAF fleets do not provide a responsive and effective capability. Although every location is reachable, northern air power as currently configured is not responsive. Scarce strategic resources, like the CP-140, are needed to provide ISTAR over the Arctic. Further, only aircraft in the south are able to prove responsive lift or support to SAR. A dual purpose ISTAR/transport capability in Yellowknife is required. This increases the CAF's Arctic presence and ability to demonstrate and control sovereignty. All the potential options, including the fitment of light ISTAR equipment to the CC-138, basing ISTAR equipped CC-130H/J in Yellowknife, or the use of advanced multi-role light aircraft include capability and cost trade-offs. Understanding the implications of these trade-offs is critical. Effective recapitalization demands nothing less.

RECOMMENDATIONS

32. Immediately commission a DRDC study to determine the optimal balance of payload, speed, austere airstrip, and ISTAR capability required.

33. Engage industry on dry-lease fleet options along with emerging lightweight COTS ISTAR solutions.

ANNEX

A: Arctic Transport Model

ANNEX A: ARCTIC TRANSPORT MODEL

1. Model Details. The performance model was generated by the Author in MS Excel. The relevant spreadsheet pages are included in the appendices.
 2. Model Assumptions. This model makes the following assumptions:
 - a. Crew operations are limited to fourteen hours of continuous operations,²⁹
 - b. Flights that exceed 50% of range require a stop for refuelling that takes one hour to complete; and,
 - c. Aircraft performance is taken as stated by manufacturer or operator.³⁰
 3. Methodology. Locations are taken from the Canadian Flight Supplement,³¹ Territorial lists of communities,³² and DEW/NWS locations from Lackenbauer et al.³³ Distances are calculated by the customary conversion of the degree, minute, second notation into decimal degrees and then to radians. Using the radian locations and the haversine formula³⁴ the distance is determined by multiplying the result with the radius of the Earth in nautical miles.

²⁹ "Canadian Aviation Regulations.", 720.16(5).

³⁰ Aircraft / Royal Canadian Air Force.; "Aircraft Fact Sheets."; Beechcraft Textron Aviation, *King Air 350ER*; "Twin Otter Technical Description ."; Piaggio Aero, *Avanti Evo*.

³¹ "Canada Flight Supplement."

³² "Communities.", "NWT Bureau of Statistics - Community Data, Community Profiles.", "Community Information."

³³ Lackenbauer, Farish and Arthur-Lackenbauer, *The Distant Early Warning (DEW) Line: A Bibliography and Documentary Resource List.*, 16 - 22.

³⁴ "Latitude & Longitude Haversine Formula."

4. Limitations. The model has not been validated by a scientific authority. The aircraft performance specifications have not been validated by technical authorities. This model is only adequate for providing indicative performance.
